Flashcards

Lesson 5

Description

Create a DefinitionController, and add a Flashcard property to both view controllers. Pass the Flashcard object to the DefinitionController via the seque.

Learning Outcomes

- Practice adding a new class to an Xcode project.
- Implement a subclass, making use of inheritance and method overriding.
- Practice using Interface Builder to bind a view controller to a specific class.
- Practice using optional properties and conditional binding.
- Discover and describe how segues can be used to pass data between view controllers.
- Observe a usage of the Swift conditional type cast operator.

Vocabulary

inheritance	extend	subclass
Identity Inspector	optional type	optional binding
method overriding	segue	UIStoryboardSegue
type casting		

Materials

Flashcards Lesson 5 Xcode project

Opening

How can we display the appropriate flashcard definition in the second view controller?

Agenda

• Add a new (*N) Swift class to the project called DefinitionController.

```
import UIKit
class DefinitionController: UIViewController {
}
```

- Discuss how DefinitionController extends the UIViewController base class, and that DefinitionController "is a" UIViewController.
- Using Interface Builder and the Document Outline (□), select the Definition Controller, and use the Identity Inspector (\tau\mathbb{*3}) to set the Class to DefinitionController.
- Run the app (***R**), tap the Definition button, and observe how the default text view text still appears.
- Discuss how the TermController obtains a Flashcard object, and the need to provide the same Flashcard object to the DefinitionController, so that it can display the definition of the particular Flashcard.
- Add a Flashcard? property to the DefinitionController class.

```
var flashcard: Flashcard?
```

- Discuss that the property is optional, because the DefinitionController initializer will not initialize the property; and that the property is a variable, because the controller will present definitions of different Flashcard objects.
- Using Interface Builder and the Assistant Editor (\tau\mathcal{H}\varphi), select the Definition Controller and create a connection from the text view to an outlet in the DefinitionController class.

```
@IBOutlet weak var definition: UITextView!
```

• Implement a viewDidLoad method in the DefinitionController, to set the definition text using the Flashcard property.

```
override func viewDidLoad() {
   super.viewDidLoad()
   if let card = flashcard {
      definition.text = card.definition
   }
}
```

- Discuss the optional binding of the flashcard property with if let.
- Using the Xcode Documentation and API Reference (公衆0), examine the UIViewController method prepareForSegue:sender:.
- Discuss how, before a segue is performed, the prepareForSegue:sender: method is called, and receives a reference to both a UIStoryboardSegue object and a reference to the interface control that triggered the segue.
- Using the Xcode Documentation and API Reference (企業0), examine the UIStoryboardSegue class reference, and draw attention to the sourceViewController and destinationViewController properties.
- Add a Flashcard? property to the TermController class.

```
var flashcard: Flashcard?
```

• Update the TermController viewDidLoad implementation, to assign a value to the Flashcard property.

```
override func viewDidLoad() {
   super.viewDidLoad()
   if let flashcard = deck.randomCard {
      self.flashcard = flashcard
      termLabel.text = flashcard.term
   }
}
```

- Discuss the differences between the deck and flashcard properties in the TermController class.
- Implement a prepareForSegue: sender: method in the TermController class.

```
override func prepareForSegue(segue: UIStoryboardSegue,
    sender: AnyObject?) {
    if let definitionController =
        segue.destinationViewController as? DefinitionController {
        definitionController.flashcard = flashcard
    }
}
```

- Explain how an object is retrieved from the segue, is casted to a DefinitionController using the as? type cast operator, and how the TermController uses its flashcard property to assign a Flashcard object to the DefinitionController flashcard property.
- Run the app (**R), tap the Definition button, and observe the correct definition appear.

Closing

Imagine if we had two buttons and two segues that transitioned to two different view controllers. How might you use the sender parameter of prepareForSegue:sender: to prepare each destination view controller depending on which button is tapped?

Modifications and Extensions

- Create a custom UIStoryboardSegue that encapsulates the assignment of the Flashcard object to the destination view controller.
- Create a custom UIStoryboardSegue class, bind it to the segue connection between the flashcard and definition view controllers, and override its perform method with a custom Core Graphics transition animation.
